

Truss Jibs

Truss Jibs - A truss jib is actually used in order to pick up and position trusses. It is actually an extended jib additional part that is equipped with a pyramid or triangular shaped frame. Typically, truss jibs are mounted on machines like for example a compact telehandler, a skid steer loader or even a forklift making use of a quick-coupler attachment.

Older style cranes that have deep triangular truss jibs are normally assemble and fastened utilizing bolts and rivets into standard open structural shapes. There are hardly ever any welds on these style jibs. Each and every bolted or riveted joint is susceptible to rusting and thus needs frequent upkeep and check up.

Truss jibs are designed with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This particular design can cause narrow separation among the smooth exteriors of the lacings. There is little room and limited access to preserve and clean them against rusting. Numerous bolts become loose and rust inside their bores and must be replaced.
