

Fork Positioner for Forklifts

Fork Positioner for Forklifts - The fork positioner is actually a hydraulic device that allows the individual driving to work the lift truck without leaving the seat. They are constructed out of high quality materials and are meant to be able to withstand the most challenging operations and work environments. Side shifting units have the extra ability to laterally position the entire load or the arms so as to facilitate more accurate lifting and position in a faster and much more efficient manner.

The unique fork pocket design can enable operators to be able to securely swing the unit's blades without any worry of damaging the positioning cylinders. This can allow the operator the alternative to either perform independent or simultaneous blade movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are required. Standard OEM carriages could be converted into blade positioners on existing units.
